

Project Teamwork Assessment

Who was your partner in this project?

Tonnar Castellano

What did you like and/or dislike about working as a team on this project? (3-4 lines)

I think what I liked best about this project was the final product was applicable and useful. Being able to see what we created on the backend of the database through the frontend and also the interactive capability was cool. What I dislike about the project was learning PHP on the fly since it did not directly correlate to the class.

Based on your best estimation, how much work did each team member contribute (Name and percentage; e.g. Singh 45%, Smith 55%)?

Painter 50%, Castellano 50%

Describe the effort put in by each team member on this project? Who did what? (1-2 paragraph)

Tonnar's main priority was focusing on creating and connecting the front-end application to the back-end database and also creating stored procedures in MySQL that will interact with user-interface pages. My main responsibility was loading, cleaning the data, updating the data, and other data concerns with the SQL backend, along with writing triggers and views associated with tabs on the web application. In regard to the final report, we split up the 4 sections evenly with Tonnar completing the Introduction and Illustration Functionality parts, and I wrote the Final Implementation and Summary Discussion components. In addition to this, both of us read over and edited the other's work to make sure that everything was agreed upon and for quality control purposes.
